PROFESSIONAL SUMMARY

Results-driven DevOps and Platform Engineer with proven experience designing, automating, and operating production-grade cloud-native infrastructure on AWS, Hetzner Cloud, and Kubernetes. Specialized in architecting end-to-end CI/CD on GitLab and Jenkins with isolated development, testing, and production environments, Infrastructure as Code with Terraform and Ansible, and full-stack observability with Prometheus, Grafana, Loki, and Tempo. Demonstrated ownership of mission-critical data infrastructure including Apache Kafka, Redis, ClickHouse, and Qdrant, zero-downtime Kubernetes CNI migrations, and delivery of multiple live SaaS products. Passionate about automation, reliability, security, and shipping resilient platforms that scale with the business.

TECHNICAL SKILLS

Cloud: AWS (EC2, S3, IAM, VPC, EKS, CloudWatch, Route 53, ELB), Hetzner Cloud, GCP
Containers and Orchestration: Docker, Kubernetes, Helm, Kustomize, EKS, Proxmox VE, containerd, Rancher, Fleet
CI/CD and GitOps: GitLab CI (self-hosted and gitlab.com), Docker-in-Docker, Jenkins, GitHub Actions, ArgoCD, Maven, SonarQube
Infrastructure as Code: Terraform, Ansible, CloudFormation
Streaming and Messaging: Apache Kafka, Kafka consumer groups, Kafka Connect, Pushgateway
Databases and Data Infrastructure: ClickHouse, Qdrant, Redis, KVRocks, PostgreSQL, MySQL, MongoDB, Alembic
Monitoring and Observability: Prometheus, Grafana, Loki, Tempo, Alertmanager, Node Exporter, Process Exporter, ELK Stack, CloudWatch
Networking and Security: Cilium (eBPF), Flannel, Traefik, Nginx, HAProxy, TLS/SSL, cert-manager, Let's Encrypt, CoreDNS, Load Balancing, IAM, HashiCorp Vault, NetworkPolicies
Storage: Longhorn, local-path-provisioner, Persistent Volumes, StorageClasses
Scripting and Programming: Python, Bash, Shell Scripting, YAML, Groovy
Operating Systems: Linux (Ubuntu, Amazon Linux, CentOS, Debian), Systemd, iptables, sysctl, eBPF
AI and Productivity: Claude Code, Prompt Engineering, AIOps, LLM tooling
Methodologies: Agile, Scrum, SRE practices, DevSecOps, Incident Response

PROFESSIONAL EXPERIENCE

DevOps Platform Engineer, Spizen Technologies | Feb 2026 - Present

- Designed and owned end-to-end CI/CD on GitLab for NoLimitNodes (nolimitnodes.com), creating fully isolated development, testing, and production environments with dedicated pipelines, environment-scoped variables, protected branches, and manual production gates.
- Built multi-stage GitLab pipelines (validate, build, test, deploy) using Docker-in-Docker runners and BuildKit registry-mode caching that cut single-service build times from approximately 10 minutes to under 2 minutes, hardened with masked secrets, file-based credentials, namespace-scoped RBAC, image vulnerability scanning, and immutable commit-pinned tags.
- Provisioned production ClickHouse and Qdrant data infrastructure using Ansible playbooks and reusable roles for idempotent installs, configuration templating, systemd service hardening, and post-install health verification.
- Operated Apache Kafka pipelines with consumer-group lag tuning and partition strategy, and Redis and KVRocks clusters with master and read replica configurations supporting workloads of approximately 12,800 operations per second.
- Used Redis intelligently as a low-latency caching, session store, and rate-limiting layer across services, and tuned eviction policies, replication delay, and slowlog thresholds to keep production tail latencies predictable.
- Set up Kubernetes worker nodes and clusters end-to-end on Hetzner and Proxmox-backed hosts, managing node lifecycle, scaling, drains, and cluster health through Rancher and Rancher Fleet for GitOps delivery; tuned Linux and Kubernetes nodes by resolving disk I/O contention, correcting MTU mismatches under the Cilium VXLAN overlay, and rightsizing memory requests to eliminate out-of-memory pod restarts.
- Executed zero-downtime CNI migration on a production Kubernetes cluster from Flannel to Cilium with eBPF kube-proxy replacement, scaling 119 Deployments and 13 StatefulSets in dependency order and validating cross-node pod networking, CoreDNS, and Traefik before resuming traffic.
- Provisioned and managed Helm umbrella charts with per-environment values for development, UAT, and production, using atomic deploys, PodDisruptionBudgets, podAntiAffinity, readiness and liveness probes, and Alembic migration preflight gates that surfaced schema drift in seconds.
- Provisioned virtual-machine partitions on Proxmox VE for every team member, enabling isolated development environments and self-service Kubernetes sandboxes across the company.
- Delivered production deployments with TLS automation via cert-manager, Let's Encrypt, and Traefik IngressRoute traffic policies for ezwallet and nolimitnodes.com.
- Built a company-wide infrastructure dashboard suite in Grafana covering every internal tool (Kubernetes, GitLab, Kafka, ClickHouse, Qdrant, Redis, Proxmox, Linux hosts), backed by Prometheus, Loki, Tempo, and Alertmanager with custom Python exporters for Kafka consumer lag, ClickHouse data freshness, and end-to-end pipeline health.

DevOps Engineer, Yebello Technology Pvt. Ltd. | Mar 2025 - Feb 2026

- Sole owner of CI/CD, infrastructure, and release engineering for MyBuildGuide (mybuildguide.com, app.mybuildguide.com), a five-service application shipped to production on a self-managed Kubernetes cluster across three environments (dev, UAT, prod).

- Authored a multi-stage GitLab pipeline (detect-changes, build, validate, deploy) with per-service change detection that cut typical pipeline runtime by 60 to 80 percent for single-service edits, using GitLab Runner on Kubernetes (Helm-installed, Docker-in-Docker) and BuildKit layer caching for fast image builds.
- Built and operated a Helm umbrella chart with per-environment values, atomic helm upgrades with --wait and timeout, PodDisruptionBudgets, readiness and liveness probes, and explicit resource requests and limits across every workload for predictable scheduling and cost control.
- Architected an Alembic migration drift preflight gate that fails the pipeline within seconds with a ready-to-copy remediation command, replacing a previously silent multi-minute Helm rollback observed during a real production incident.
- Wired Traefik ingress with cert-manager and Let's Encrypt for automatic TLS, Longhorn-backed PostgreSQL StatefulSets per service with Alembic migrations as Helm post-upgrade Jobs, and a dedicated pgAdmin deployment using a read-only Postgres role for safe developer database introspection.
- Hardened the supply chain by keeping all application secrets exclusively in Kubernetes Secrets with a narrowly-scoped deployer ServiceAccount and namespace-bound RBAC, never in Git or values files.
- Owned platform-engineering and infrastructure delivery for multiple Propulse property-site projects including TVS Emerald Altura, TVS Emerald Auralis, and Puravankara Flow, standardizing GitLab CI/CD pipelines, container images, environment configuration, and release workflows so developers could ship without touching infra.
- Acted as the platform engineer across teams by maintaining shared Helm charts, Kubernetes manifests, base Docker images, and runbooks, and unblocked developers via routine kubectl debugging (logs, describe, exec, port-forward), reducing deployment friction across services.
- Administered Ubuntu and Debian Linux servers for service uptime via systemd unit management, journalctl log review, disk and inode monitoring, cron scheduling, and SSH key-based access hardening; configured Prometheus scrape jobs, Grafana dashboards, and Alertmanager routing for on-call notifications.

PROJECTS

Autonomous AIOps Gateway | Python, Linux, Telegram API, Systemd, Nginx

- Architected a self-healing infrastructure assistant that automated Linux server administration and service recovery actions through a Telegram bot interface, enabling on-call engineers to triage and remediate incidents from mobile devices.
- Developed custom AI Skills to monitor Nginx access and error logs in real time, classify anomalies, and execute automated remediation playbooks via secure Systemd unit integrations, reducing mean time to recovery (MTTR) for common incident classes.
- Implemented role-based authorization, command audit logging, and least-privilege Systemd service configurations to prevent unauthorized remediation actions in shared environments.

NSE Options Trading Bot | Rust, Python, AWS (EC2, VPC, Elastic IP, IAM, ECR, S3, Systems Manager, Route 53), Docker, Linux, Systemd

- Architected and deployed an automated NSE options trading bot on AWS, provisioning a custom VPC with public and private subnets, Internet Gateway, NAT routing, and an Elastic IP for stable broker-API egress, on a low-latency EC2 instance hardened with security groups locked to broker endpoints and admin SSH origins.
- Containerized the multi-module Rust signal engine and Python orchestrator with Docker, automated cargo build and cargo test gates in CI, published commit-pinned images to Amazon ECR, and ran the bot as a Systemd-managed service on EC2 with EBS-backed persistent state for trade logs and position snapshots.
- Managed cloud access end-to-end with least-privilege IAM roles, AWS Systems Manager Parameter Store for broker API keys and session tokens kept out of Git and AMIs, S3 for archived trade logs, and Route 53 for predictable hostname routing, demonstrating hands-on ownership of an end-to-end AWS deployment topology.

Medicure, InsureMe and FinanceMe | Kubernetes, Terraform, AWS, Jenkins, Docker, Prometheus, Grafana, Ansible

- Provisioned highly available AWS EKS and EC2 clusters across multiple Availability Zones using Terraform modules for repeatable Infrastructure as Code management of networking, IAM, security groups, and worker node groups.
- Automated environment provisioning and microservices deployment using Ansible playbooks and Jenkins pipelines, with branch-based promotion across development, staging, and production environments.
- Implemented a distributed Jenkins Master and Agent architecture using EC2 worker nodes for parallel pipeline execution, integrated with Docker Hub for image distribution and SonarQube for code-quality gates.
- Deployed a full-stack Prometheus and Grafana monitoring solution covering node-level, container-level, and application-level metrics, with Alertmanager routing for incident notifications.

Zomato Clone Application | SonarQube, Jenkins, Docker, AWS, Trivy, Nexus

- Designed and implemented a complete CI/CD pipeline in Jenkins for a containerized full-stack web application, automating build, static analysis, security scanning, and deployment to AWS EC2 instances.
- Integrated SonarQube into the Jenkins pipeline to enforce 80 percent code-coverage thresholds and automatic quality gates, blocking merges that introduced regressions or critical code smells.
- Added Trivy container image vulnerability scanning and OWASP dependency checks as mandatory pipeline stages, preventing images with high or critical CVEs from reaching production.
- Configured Nexus Repository Manager for build-artifact storage and Docker image promotion across environments, with versioned releases tied to Git commit identifiers.

CERTIFICATIONS

Scalable Kubernetes • Docker Essentials • AWS Expert • DevOps Engineer - StarAgile

EDUCATION

Master of Computer Applications (MCA) - IGNOU | 2023 - 2025
